/ Activating the primary or secondary server autostart script

### Activating the primary or secondary server autostart script

If you previously deactivated the autostart script on the system, you can reactivate it. Reactivating the autostart script causes the RICOH ProcessDirector base product or secondary server to start automatically when the system starts.

**Note:** When you install RICOH ProcessDirector, the default is that it activates the autostart script. You need to activate the autostart script only if you previously deactivated it.

To activate the autostart script:

1. Log in as the root user.
2. Access the command line.
3. Add two symbolic links to reactivate the script. Enter these commands:  

```
ln -s /etc/init.d/aiwserve /etc/init.d/rcn.d/Snnaiwserve  
ln -s /etc/init.d/aiwserve /etc/init.d/rcn.d/Knnaiwserve
```

*n* and *nn* are numbers that determine when the script runs. You noted these numbers when you deactivated the autostart script.
