Setting up to exchange data with web services

You can set up to exchange data with web services by running the sample workflow. After you examine how the sample workflow is set up, see the related topics that explain how to set up web service input devices and notifications. You can also examine the related topics on step templates.

In this section:

[Running the sample workflow for processing orders retrieved from REST web services](#)

The **RestfulWebServiceWF** workflow shows how to process orders retrieved from REST web services that simulate a website for ordering books. A REST web service input device, a **CallRESTService** step, and a REST web service notification exchange data using the web services. The workflow also gives examples of these steps: **ConvertJSONToXML**, **ApplyXSLTransform**, **CreateJobsFromXML**, and **DownloadFile**.
