Document properties configuration file

The document properties configuration file defines custom document properties to use with document processing features. The file is named `docCustomDefinitions.xml`.

You set up this file when you prepare configuration files after you install the PDF Document Support or AFP Support feature. You update the file whenever you need to define a new custom document property. The file identifies which custom document properties are managed in the database, and which properties exist only in the document properties file.

⬇ **Note:** If you define custom document properties from the **Administration** tab, you do not have to create or edit this file.
