# Web service notifications

You can configure REST and SOAP web service notifications.

## In this section:

### [Preparing to send status to REST web services](#)

You can use notification objects to send status to a REST web service for an application. For example, you can create a notification object to monitor when a job enters the **RetainCompletedJobs** step in a workflow that processes orders. When that event happens, the notification object can send the application information about the job, such as the order number and customer name.

### [Preparing to send status to a SOAP web service](#)

You can use notification objects to send status to a SOAP web service for an application. For example, you can create a notification object to monitor when a job enters the **RetainCompletedJobs** step in a workflow that processes orders. When that event happens, the notification object can send the application information about the job, such as the order number and customer name.
