# Defining a workflow to send AFP jobs to Quadient Inspire Designer

Copy and customize one of the AFP workflows to create a workflow that sends jobs to Quadient Inspire Designer.

These AFP workflows are available when the Quadient Inspire Connect and AFP Support features are installed. These workflows include:

- **ComposeAFPDataRetrieved**  
Use this workflow when you want to send a WFD file and one or more raw data files to Quadient Inspire Designer and generate new AFP files as part of your workflow and you want to store the data files in an external location.  
This workflow expects you to submit the WFD file listed in the **ComposeAFP** step template. The workflow creates an overrides file from the values of the **Data files** and **Data modules** properties. Data files are not submitted as part of the job; the workflow expects to find the files in the locations listed in the overrides file.
- **ComposeAFPDataSubmitted**  
Use this workflow when you want to send a WFD file and one raw data file to Quadient Inspire Designer and generate new AFP files as part of your workflow and you want to submit the data file as part of the print job.  
This workflow expects you to submit a WFD file and the data file.

⬇ **Note:**

- You can only submit one data file as part of a print job. If the job requires more than one data file, you must store the data files in another location and use the **ComposeAFPDataRetrieved** workflow instead.

- **ReformatAFP**  
Use this workflow when you have an existing AFP file that you want to send to Quadient Inspire Designer to be reformatted or otherwise modified.  
This workflow expects you to submit a WFD file and, optionally, an existing AFP file.

To define a workflow to send jobs to Quadient Inspire Designer:

1. Click the **Workflow** tab.
2. Right-click the appropriate workflow from the list and select **Copy**.
3. Name the copy of the workflow, fill in or edit other values that you need, and click **Continue**.
4. Find the **ComposeAFP** step template:
  - If you copied the supplied **ComposeAFP** step template and renamed it, delete **ComposeAFP** and add your new step template to the workflow.
  - If you modified the supplied **ComposeAFP** step template without copying it, delete this version of **ComposeAFP** and add the modified version to the workflow.
5. Right-click the **ComposeAFP** step and select **Properties** to display the job default values. Update any values that are different for this workflow.
6. Click **OK**.
7. Add and update any other step templates that the workflow requires.
8. Save and enable the workflow.
