# RICOH InfoPrint Manager

RICOH InfoPrint Manager is a flexible and scalable print management solution for AIX, Linux, or Windows that provides many choices in expanding and managing your print environment. RICOH InfoPrint Manager can process print jobs that contain references to color management resources and interact with centralized resource libraries.

When RICOH InfoPrint Manager receives AFP or line data print jobs, it processes CMRs and data objects similar to the way it processes other AFP resources. You can add the resource libraries that you create using AFP Resource Installer to the Location of presentation object containers property (also called the resource-context-presentation-object-container attribute) of your actual destinations. Then, RICOH InfoPrint Manager can search those resource libraries to find data objects and CMRs when print jobs request them.

## In this section:

[Enabling capture for CMRs](#)

If the jobs that run through your system use the same CMRs, you might want to enable your actual destination to capture inline CMRs.

[Page Printer Formatting Aid \(PPFA\)](#)

PPFA is a feature of RICOH InfoPrint Manager that lets you create form definitions and page definitions for use with your AFP print jobs. You can use PPFA to associate CMRs with form definitions and page definitions for your color print jobs.
