FusionPro Connect

The FusionPro Connect feature lets you use FusionPro to compose documents based on predefined templates. FusionPro Connect uses FusionPro Server to process the records in a data file in the format you select.

This feature adds the **RunFusionPro** step template to the list of supplied step templates. When configured correctly, the step template produces print files from any supported data file using the FusionPro composition engine.

The FusionPro Connect feature lets you select different templates for the composition of the output file. The templates are first created or uploaded in FusionPro and then made available in RICOH ProcessDirector. You can also include an imposition template created with FusionPro Imposer which can help you arrange multiple pages on a sheet.

Working simulation

FusionPro Connect provides a sample workflow called **FusionProSample**, a sample hot folder input device, and a sample FusionPro template. If you connect RICOH ProcessDirector to your FusionPro Server, you can load the sample template and run the sample workflow.

When you enable the sample input device, a sample CSV file is submitted to the workflow. The workflow sends the CSV file to FusionPro Server. The FusionPro server processes the CSV file and composes the file into a PDF file, using the options set in the RunFusionPro step in that workflow.

System configuration

To work with RICOH ProcessDirector for Linux, FusionPro Connect must be installed on a computer running Windows Server 2019 or Windows Server 2022 that is configured as a RICOH ProcessDirector application server.
