Configuring to process jobs with FusionPro

After you configure the connection to FusionPro Server, set up input devices and the RunFusionPro step template, then create a workflow that sends jobs to FusionPro for processing.

To configure and to process jobs with FusionPro Server:

1. Add and enable a hot folder input device to receive FusionPro input files.
2. Tune the **RunFusionPro** step template to run on the correct server:
 1. Click the **Workflow** tab.
 2. In the left pane, click **Step Templates**.
 3. Right-click the **RunFusionPro** step template and select **Properties**.
 4. On the **Tuning** tab, under **Servers to use**, select **Run on specific servers**, then select the correct application server.

 **Note:**

- If there are any changes regarding the FusionPro Server address, make sure to update the step template to use the resources from the new FusionPro server.

3. Add the **RunFusionPro** step template to a workflow.
 1. Click the **Workflow** tab.
 2. Open the workflow that you want to use to send jobs to FusionPro.
 3. In the workflow editor, click the side panel in the top right corner of the window.
 4. Go to **Steps** and expand the **VARIABLE DATA** group.
 5. Drag the **RunFusionPro** step into position and make sure it is connected to the workflow.
 6. Right-click the step and select **Properties** to see the properties and job defaults.
 7. Update the properties as needed. Refer to the ? help for additional information about each property.
 8. Click **OK**.
 9. Save the workflow.
