

## Configuring

[Configuring](#) / Banner pages

### Banner pages

Banner pages can be printed at the beginning and end of a job to help distinguish one job from the next. If the AFP Support feature is installed, AFP print jobs can also include banner pages between copies of a multi-copy job. Banner pages usually include identifying information about the jobs, such as the job ID, file name, and the time the job was submitted.

#### In this section:

##### [Identifying properties for banner pages](#)

Update the `banner_page_property_values.cfg` configuration file to define the properties that you can include on banner pages. The configuration file defines the elements that can print on banner pages, including properties of jobs, orders, printers, load plans, and other objects, system settings, and text strings.

##### [AFP banner pages](#)

AFP banner pages include header, trailer, and separator pages. They can be used (in any combination) with AFP print jobs printed to AFP printer objects. You can change the contents and appearance of those banner pages, as well as the fonts used to print them.

##### [PDF banner pages](#)

PDF header pages and trailer pages can be used with PDF jobs. They can also be used with jobs in other data streams, but only if the printer they are sent to supports printing PDF files. You can change the contents and appearance of PDF banner pages, and the fonts used to print them.
