Overview

Integration features

Integration features help you connect RICOH ProcessDirector to other products, including products from certain other companies. These features provide objects that make integrating with the other applications easier. The other applications must be purchased separately.

In this section:

Avanti Slingshot Connect

The Avanti Slingshot Connect feature lets you exchange information with the Avanti Slingshot Management Information System (MIS) software. After creating orders, Avanti Slingshot can send PDF print jobs with JDF job tickets to RICOH ProcessDirector. Alternatively, RICOH ProcessDirector can send Avanti Slingshot the information required to create orders for jobs in RICOH ProcessDirector workflows.

Cut Sheet support for Kodak feature

The Cut Sheet support for Kodak feature provides support for the Kodak Digimaster printer.

Cut Sheet support for Xerox feature

The Cut Sheet support for Xerox feature provides support for specific models of Xerox printers.

FusionPro Connect

The FusionPro Connect feature lets you use FusionPro to compose documents based on predefined templates. FusionPro Connect uses FusionPro Server to process the records in a data file in the format you select.

MarcomCentral Connect

The MarcomCentral Connect feature illustrates how you can integrate the online-storefront and web-to-print functions of MarcomCentral® into your production workflows. A SOAP web service input device retrieves orders for print, digital, and other items from MarcomCentral. RICOH ProcessDirector creates an order for each MarcomCentral order and a job for each order detail. RICOH ProcessDirector downloads files for print items and notifies MarcomCentral to close out the order when all the items complete their processing.

PitStop Connect

PitStop Connect lets you integrate preflight operations that use Enfocus PitStop Server 10 or higher into your workflows for PDF print jobs.

Quadient Inspire Connect

The Quadient Inspire Connect feature extends RICOH ProcessDirector to make it easier to interact with Quadient Inspire Designer v8 and higher. The feature adds system objects tailored to work with files created by Quadient Inspire Designer so they can be submitted to the processing engine to generate print jobs as part of a print workflow.

RICOH Predictive Insight Connect

The RICOH Predictive Insight Connect feature lets you send data collected by the **Reports** feature in the PostgreSQL database to the RICOH Predictive Insight application in the cloud.

Ultimate Impostrip® Connect

Ultimate Impostrip® Connect lets you integrate the impositioning functions of Ultimate Impostrip® into your workflows.
