Overview

Document properties file

The document properties file (DPF) can contain properties of documents in a job. The file is stored in the spool directory for the job.

The document properties file is created automatically by the step templates **IdentifyPDFDocuments**, **IdentifyDocuments**, **ReadDocumentsFromDatabase**, **CreateJobsFromDocuments**, and **CreateAFPJobsFromDocuments**. The file is structured like a table; the first line identifies the properties that are in the file, and each additional line contains the property values for each document. RICOH ProcessDirector uses the information in the document properties file to keep track of the documents associated with each job.
