Overview

Pipeline Manager

Pipeline Manager mode of RICOH Visual Workbench lets you configure and run a set of filters, in a specific order, to process large AFP files quickly and efficiently.

The AFP Indexer and AFP Enhancer modes have filters. If AFP Editor and Whitespace Manager are installed, they also have filters. By using the filters for modes and plug-ins, you can pre-process your AFP files. For example, you can generate page groups and indexes, add bar codes, and write the resulting AFP file, all in 1 process. The input AFP is read once, and the output AFP is written once.
