Configuring

Configuring RICOH ProcessDirector to work with FusionPro

To work with FusionPro, you must connect RICOH ProcessDirector to FusionPro Server which is the composition engine that lets you create print files based on the input data files. To send the files to FusionPro Server, you can add the RunFusionPro step template to a workflow.

Before configuring the connection to FusionPro from RICOH ProcessDirector:
- You must install a RICOH ProcessDirector application server feature on the machine where FusionPro is installed.
- Set the application server to run as a service on the machine where FusionPro is installed. The FusionPro service must run under the same user as the RICOH ProcessDirector application server.

To configure RICOH ProcessDirector to work with FusionPro:

1. Log in to RICOH ProcessDirector.

2. Click the **Administration** tab.

3. In the left pane, click **Settings ⟹ FusionPro Connect**.

4. Under **FusionPro system**, select the application server where FusionPro is installed. If you have not yet created the application server object, click the plus sign (➕) to add it.

   > ⬇ Note:
   > ○ When creating the application server, set the value of the **In general server pool** property to **No**.

5. Click **Get templates** to retrieve all templates available on FusionPro Server.
   The FusionPro templates table displays all available templates and template groups.

> ⬇ Note:
> • If there are any changes that might affect the connection to the machine where the application server is installed, you must reconfigure the connection to the FusionPro server.
