Overview

Advanced Transform

The Advanced Transform feature is a customizable component. You can purchase transforms for the input and output data streams that you need.

Transforms to and from these data streams are available:

- AFP
- BMP, GIF, JPEG, PNG, TIFF (only as input data stream)
- PCL
- PDF
- PostScript

When you order the Advanced Transform feature, you specify which input data stream transforms and which output data stream transforms you need. When you configure workflows, you can combine the input and output data stream transforms as needed.

> ⊙ Note:
> - When you send jobs with PDF or image files included in the AFP object containers, you must install the appropriate input data stream transform to process them correctly. For example, for AFP files containing images, you must use the **InputImage** transform. When installed, the **InputImage** transform converts automatically the jobs containing the supported images. For AFP files containing PDF data, you must install both the **InputAFP** and **InputPDF** transforms.

After you install and activate the Advanced Transform feature, you must install each input and output datastream transform you want to use. Each transform is licensed separately, so you can choose exactly which inputs and outputs you need.

> ⊙ Note: The **InputPDF** transform is a prerequisite for the **InputImage** transform.
