Overview

Electronic Presentment

The Electronic Presentment feature provides a sample workflow that receives jobs from a sample input device and uses a sample history record notification to capture the times when jobs are printed and mailed. The workflow stores jobs, documents, property values, and history information in a sample repository.

This no-charge feature is provided with the base product but is not installed by default.

> **Note:** You must have the Archive feature installed to use the Electronic Presentment feature.

In this section:

Running the Electronic Presentment sample workflow

The Electronic Presentment feature provides a sample workflow that stores data in a sample repository.
